

# Cronlord

## Destination Automation

Welcome to the fast paced world of technologically advanced business enterprises. Where most industries, if not all, have come to accept the fact that automation of manual processes is inevitable. For various purposes, one is to minimize if not to avoid the chances of errors. High levels of availability, reliability, and productivity are also just a few of the rationale, hence the reasons for process automation.

Process automation is one of the most valuable applications of data science and Machine Learning (ML) to businesses. Be it a small private enterprise or a large publicly-traded firm, it is these processes that keep every business running. Although some of these processes were probably intentional in terms of design and implementation at the onset, others may have been developed as deemed necessary. The challenge however is assembling them to come up with a group of related tasks all together.

## How great it is to automate

Businesses are protected by automation from bad decision-making and replace it with informed decisions. The result, an analysis of how the company is operating with a well-rounded set of rules as guidelines. This time, decisions are taken out from a person's hand, but instead put together then setting it to execute automatically the correct series of actions upon meeting specific circumstances. The so-called "Cron" exactly does that.

Cron, also known as cron job, is a time-based job scheduler software utility in Unix-type computer operating systems. Originated from the word "chronos", it is used to schedule jobs to run periodically at fixed times, dates, or intervals. Designed to carry out repetitive tasks as defined in a schedule based upon calendar and event conditions, it is used to set up and maintain in software environments for users or administrators.

## The lord that automates workload

**Cronlord** is TekMonk's workload automation solution that helps organizations to enable planning and control in processing complex systems. It increases productivity with powerful plan-driven as well as event-driven scheduling for

running and monitoring workloads wherever the user is. Administrators or resource managers can precisely schedule on which day and time the workload should be delivered. Plus, it increase business agility with workload automation, design thinking, & agile development

## Key Features

Some of the features present in Cronlord are the following:

- Advanced automation with easy to change enterprise job scheduling
- Execution of decisions that are based on gathered data
- Workload automation that can be integrated with other scheduling system
- Job reporting and error handling, so tasks that have failed using Artificial Intelligence (AI) can still be recovered
- Alerting and visual scheduling via dashboards to ensure jobs are running smoothly
- Easy integration with *XForge*, the universal DevOps tool by Tekmonks, for end to end automation

## Benefits

With optimum utilization, Cronlord can provide the benefits to any business such as:

- Manual tasks assignment, performance checking, and feedback gathering from employees that costs a lot of time and money to a business can be cut down to almost zero.
- Helps automate time consuming tasks with Cronlord that functions as a collaboration tool ultimately promoting employee development.
- Transparency is ensured all throughout the whole process ensuring accuracy and consistency yet reducing risk as well as errors.
- Tasks assigned and completed by employees or teams without unnecessary delay, contributes to increased overall productivity.
